Exploring code download and upload
I'll check Replit's current guidance for downloading a project or pushing it to GitHub, then I'll give you the simplest steps.
4 actions
The easiest way is to connect the project directly to GitHub from Replit:
1. Open the project's Git pane in the editor.
2. Connect your GitHub account.
3. Choose or create a repository, then follow the prompts to commit and push the project.
If you just want a copy on your computer first, open the three-dot menu at the top of the file tree and choose Download as zip. You can then upload or push that code to a GitHub repository.
Before pushing, make sure no .env files or credentials are included.
